

Homework 0: Display your eid

Submission:

All submissions should be done via github. Refer to the course home page about setting up your github and how to submit assignments. We will post the invitation link for hw0.

Overview:

This assignment will get you familiar with Android Studio and github, and ensure that you have a working environment.

For most of you, this will likely take less than 15 minutes. However, if you have trouble setting up Android Studio then it could take much longer. Don't wait until the last minute, and please ask for help if you need it.

Directions:

You are given a simple hw0 directory with a README file in it. Please fill in the contents of the README, which asks for information like your name.

For this project, you will create an app that displays your EID. Simple as that. Use Android studio to create a blank Kotlin project (API 28) in the hw0 directory. This process will not overwrite the README, but it will create more files that you will add to your git repository.

Take a screenshot of your emulator when it is running your app (that displays your eid). Include this screenshot in your submission in a file called screenshot.jpg. It should be in the hw0 directory, along with your README file and the files generated by Android Studio.

Please submit all of the files generated by Android Studio. You should be able to download your repository and build it within Android Studio. You can test this correctness property.

The README file has the following tags, which you should fill in. I hope the information they request is self-explanatory. For homework, your collaborator list should be empty, but if you talk to someone deeply about an assignment, just note that in the README. Time is the number of hours it took you to do the assignment.

1. Name:
2. EID:
3. Email:
4. Time:
5. Slip days:
6. Collaborators:
7. Comments:
8. Video demo: None
